TENTO / PART 2

One human task.

Supply verified property policies

The configured production tenant currently has no active policy documents or canonical policy claims. An authorized property representative must provide the real source material before policy-backed maintenance outcomes can be validated.

1. Share existing approved documents

Provide the property maintenance procedures, applicable lease clauses and emergency guidance that this application is permitted to use. Existing original documents are sufficient; you do not need to create database rows or write code.

2. Identify their applicability

For each source, identify the property or organization, jurisdiction, effective date, version and authorized source owner. Confirm which copy is approved. If the document already contains these details, point to them rather than rewriting them.

3. Confirm permitted outcomes

Confirm which maintenance trades can be handled in-house and which decisions the approved policies authorize. Preserve any limits, exclusions and required emergency instructions.

Engineering handles the rest

Source formatting, immutable versioning, exact citation spans, policy-claim configuration, import validation and the retrieval/faithfulness evaluation will be completed from those verified inputs. Synthetic evaluation documents will stay outside production.

No passwords, API keys, resident records or invented policies are required for this handoff.
