Tento Resident OS

Remaining owner inputs | 24 October 2026

The main application, four workspace entry points and cleanup are deployed. GitHub quality and production health checks passed. Only real account access, property evidence and account preferences remain below.

https://tento-resident-os.vercel.app

1. Identify a separate resident account when needed

The approved account is now a technical administrator. Fresh sign-in and access to administrator, maintenance and owner workspaces were verified live. Its identity, tenancy and tickets were preserved. To use resident submission again, supply the intended separate resident email and correct membership details. No replacement identity was invented.

2. Supply approved property policies

Provide the actual approved maintenance policies and confirm available in-house trades. The assistant can prepare versioned sources and exact citation spans. Until this evidence exists, the live agent saves reports and safely abstains; synthetic test documents must not be imported.

3. Confirm backup and spending preferences

Confirm Supabase backup retention and restore arrangements on your actual plan, plus model-provider spending limits and alert recipients. These account-level decisions cannot be inferred from runtime credentials. No paid upgrade was purchased.
